Because oil is the lifeblood of the U.S. economy, The Center for North American Energy Security endorses government policies which allow North America's vast unconventional resources—such as oil sands and oil shale—to be developed with modern technologies producing clean transportation fuels for America's energy security. The American Energy Innovation Act taps into the creative genius of American ingenuity to encourage new solutions for more efficient use of energy, as well as new technologies to produce more energy from our vast domestic resources. The current Congress too often takes negative, restrictive steps to address energy issues, HR 2300 is a most welcome positive step to balance the supply and demand of our energy needs. CNAES strongly supports HR 2300.
